## **GPS Signal Description**

1. The baseband signal **transmited** by the satellite is given as

$$S(t) = S_{PPS}(t) + jS_{SPS}(t) \tag{1}$$

- $S_{SPS}(t) = \sum_{i=-\infty}^{\infty} c_{sps}(|i|_{L\_sps}).d([i]_{CD\_sps}).rect_{T_{c,sps}}(t-iT_{c,sps})$  Standard Positioning Service
- $S_{PPS}(t) = \sum_{i=-\infty}^{\infty} c_{pps}(|i|_{L-pps}).d([i]_{CD-pps}).rect_{T_{c,pps}}(t-iT_{c,pps})$  Precision Positioning Service
- 2. Let  $x_{in}[n]$  be the incoming signal at the **receiver** end and is given as

$$x_{in}[n] = A(t)s_T(t - \tau(t))e^{j(2\pi f_D(t)t + \phi(t))}|_{t=nT_s} + n(t)|_{t=nT_s}$$
(2)

where

1.

- A(t) is Amplitude
- $s_T(t)$  is Complex baseband signal
- $\tau(t)$  is code delay(time varying)
- $f_D(t)$  is Doppler shift(time varying)
- $\phi(t)$  is carrier phase shift(time varying)
- n(t) is Random noise with zero mean
- $T_s$  is Sampling period
- $f_s$  is Sampling frequency

## Pseudo code for GPS Signal Acquisition

## 1.1 Functions for computing the PRN codes of GPS satellite

```
(a) g1_lfsr()
            state = 0x3FF
            Declare an array out[1023]
            for i=0 to i=1022
                  \operatorname{out}[\mathbf{i}] = (\operatorname{state} \gg 9) \& 0x1
                 new_bit = ((\text{state} \gg 9) \oplus (\text{state} \gg 2)) \& 0x1
                  state = ((state \ll 1) \mid new\_bit) \& 0x3FF
            end for
      return out
(b) g2_{lfsr}(tap0,tap1)
            state = 0x3FF
            Declare an array out[1023]
            tap0 = tap0-1
            tap1 = tap1-1
            for i=0 to i=1022
                  \operatorname{out}[\mathbf{i}] = ((\operatorname{state} \gg \operatorname{tap0}) \oplus (\operatorname{state} \gg \operatorname{tap1})) \& 0x1
                  new_bit = ((state \gg 9) \oplus (state \gg 8) \oplus (state \gg 7) \oplus (state \gg 5) \oplus (state \gg 2) \oplus (state \gg 1)) & 0x1
                  state = ((state \ll 1) \mid new\_bit) \& 0x3FF
            end for
      return out
(c) combine_g1_g2(g1,g2)
            declare out[1023]
            for i=0 to i=1022
                  \operatorname{out}[\mathbf{i}] = \operatorname{g1}[\mathbf{i}] \oplus \operatorname{g2}[\mathbf{i}]
            end for
      return out
```

## 1.2 Main function

- 1. PRN Code frequency  $f_c$  is 1.023Mhz
- 2. Sampling frequency  $f_s$  is 2.048Mhz
- 3. The number of samples N for 1ms is 2048

/\* Array to store Phase selector values for 32 satellites - 2 values per satellite\*/

- 4. Static array SVs[64] = [2, 6, 3, 7, 4, 8, 5, 9, 1, 9, 2,10, 1, 8, 2, 9, 3,10, 2, 3, 3, 4, 5, 6, 6, 7, 7, 8, 8, 9, 9,10, 1, 4, 2, 5, 3, 6, 4, 7, 5, 8, 6, 9, 1, 3, 4, 6, 5, 7, 6, 8, 7, 9, 8,10, 1, 6, 2, 7, 3, 8, 4, 9]
